JOY CONSULTANT

AI-POWERED REAL ESTATE PLATFORM
Website Development Prompt

Project: Joy Consultant **Industry:** Land buying, sales, investment and property consultancy
Market: Nigeria **Backend:** Supabase

1. PROJECT OVERVIEW

Develop a professional, responsive and intelligent real estate website called **JOY CONSULTANT**, specialising in land sales, land acquisition, property consultancy and real estate investment opportunities. The platform must operate as a complete digital real estate business system where customers can explore available lands, view property details, submit purchase enquiries, book inspections, make orders, communicate with the business and track their activities. Integrate Artificial Intelligence throughout the platform to solve real-life customer and business problems, automate repetitive tasks and improve customer experience.

2. WEBSITE PAGES AND FEATURES

- **Home:** Hero section, welcome message, property search, featured lands, available locations, latest listings, services, testimonials, AI chatbot and clear calls to action.
- **About Us:** Company introduction, mission, vision, values, objectives, professional approach and reasons customers should trust Joy Consultant.
- **Services / Products:** Land and service listings with images, prices, locations, land sizes, descriptions, documentation status, availability and purchase/enquiry options. Include search, filtering and sorting.
- **Contact:** Contact form, phone, WhatsApp integration, email, office address and Google Maps location.
- **Authentication:** Customer registration, login, logout, password recovery and secure session management using Supabase Auth.
- **Customer Dashboard:** Bookings, orders, purchase enquiries, saved properties, messages, payment records and profile information.
- **Admin Dashboard:** Secure management centre for authorised administrators to manage all business activities.

3. AI-POWERED DIGITAL SOLUTIONS

A. AI Real Estate Chatbot

- Active, responsive chatbot available throughout the website.
- Answer questions about actual listings, prices, locations, documentation, payment processes and services.
- Help customers find properties based on budget and preferred location; collect leads and contact details with consent.
- Assist with bookings and enquiries, maintain conversation context, and escalate complex questions to a human administrator.

B. AI Business Assistant (Admin Side)

- Summarise daily, weekly and monthly business activities; analyse enquiries, bookings, sales and leads.
- Identify potential customers and follow-up opportunities; generate professional customer responses.
- Provide sales performance reports and business insights, identify inactive leads, and answer administrative questions using real database records.

C. AI Property Recommendation System

Recommend suitable land/property listings based on customer budgets, preferred locations, land sizes and investment interests. AI must use actual platform information and must never invent availability, prices, ownership details or legal documentation.

4. ADMIN DASHBOARD AND BUSINESS MANAGEMENT

Create a professional dashboard with live statistics and functional management modules:

- **Bookings:** Property inspection appointments and booking status.
- **Orders:** Land purchase orders and transaction progress.
- **Leads:** Prospective buyers and interested customers.

- **Messages:** Customer enquiries and chatbot escalations.
- **Products:** Land listings, images, prices, locations and descriptions.
- **Customers:** Registered users and their activities.
- **Payments:** Payment records, transaction references and payment status.
- **Reports:** Sales, bookings, lead conversion and business analytics.

Provide Create, Read, Update and Delete (CRUD) operations for appropriate modules, plus status tracking, search, filtering, notifications, exportable reports and activity logs.

5. DATABASE AND BACKEND – SUPABASE

Use Supabase as the primary backend infrastructure. Implement Supabase Authentication for registration and login, PostgreSQL for business records, Supabase Storage for property images and documents, Row Level Security (RLS) to protect customer and administrative data, and secure database relationships and role-based permissions.

Create appropriate tables for: profiles, properties, services, bookings, orders, leads, messages, payments, favourites, chatbot_conversations, chatbot_messages, notifications and audit_logs.

All customer and administrator actions must save to Supabase and update the dashboard in real time where appropriate. Never expose Supabase service-role keys or AI API keys in frontend code.

6. DESIGN AND USER EXPERIENCE

Brand: JOY CONSULTANT **Colours:** Deep Navy Blue, Gold and White
Style: Elegant, professional, clean, modern and trustworthy.

Use quality real estate images, professional typography, attractive property cards, smooth navigation, subtle animations and clear calls to action. Make the platform fully responsive and optimised for mobile phones, tablets and desktop computers. Prioritise fast loading, accessibility, SEO and simple navigation.

7. FUNCTIONALITY, SECURITY AND TESTING

- Secure authentication and role-based access; proper form validation and error handling.
- Functional booking and order workflows; working contact forms and lead capture.
- Real database integration; secure Paystack payment integration with server-side payment verification through webhooks.
- Email and in-app notifications; AI chatbot and AI business assistant integrations.
- Loading indicators, empty states, and clear success/error messages.
- No hardcoded dashboard statistics or fake customer records. All bookings, orders, leads, messages and products shown must come from actual database records.

8. FINAL DEVELOPMENT INSTRUCTION

Build JOY CONSULTANT as a complete, production-ready AI-powered real estate management and customer engagement platform, not just a frontend demonstration. Before completion, test every page and navigation link; registration, login and password recovery; database operations; property creation, editing and deletion; bookings, orders, leads and messages; both AI assistants; administrator permissions and customer data protection; and mobile/desktop responsiveness. Fix all errors and broken functionality.

Deliverables: Complete source code, Supabase SQL schema, environment-variable documentation and step-by-step deployment instructions. Every advertised feature must be implemented, connected and tested. Where an external API key or service configuration is required, identify it clearly and provide setup instructions rather than pretending the integration is operational.

ADDITIONAL RECOMMENDED FEATURES

- **Land Verification & Documentation Tracker:** Let customers view the recorded status of documents such as survey plans, deeds of assignment and Certificates of Occupancy (C of O). Show only statuses supported by actual records.
- **Virtual Land Inspection Booking:** Allow customers to book physical inspections or request virtual consultations before purchasing.
- **AI Investment Guidance:** Let customers ask questions such as, “I have ■5 million. Which available land options can I consider, and what should I check before buying?” Use actual listings and provide general guidance without guaranteeing returns.

Architecture recommendation: *Use Supabase for authentication, database and storage, and connect the AI model through a secure backend or serverless function. Build in phases: (1) frontend, Supabase database, authentication and property management; (2) bookings, orders, payments and admin reporting; (3) advanced AI chatbot and business assistant.*
